Backend: MongoDB

Node JS – Product model

The following exercise contains the following subjects:

◆ mongoose

Instructions

Let's create a mongoose product modelwith validation for an e-commerce site.

The product should have the following:

◆ name, a string, which is required and should be unique.

◆ category, a string, which is required.

◆ isActive, a boolean.

◆ details, which is an embedded object that includes:

• a description, a string, which is required and has to be at least 10 letters in length.

• Price, a number, which is required and has to be a positive value,

• discount, a number, which is not required but the default is 0 if not inputted.

• array of images which must include at least two images

- a phone number which is required and has to be a valid Israeli phone number.
- DateAdded, which by default gives the current date

Add at least 3 products to your database.

Feel free to add more validation or keys to your model
